Data Center Consolidation Enables Smooth Migration

BACKSTORY

Enterprise data center consolidation during an acquisition is critical to the success of a merger. In order to move assets from one data center environment to another, it is important to inventory the assessment of data, understand application dependencies, and develop a migration plan.

A large multinational technology company undergoing a strategic acquisition sought a partner to manage their data center and system administration migration, as it looked to consolidate operations. In addition, they needed a partner that could seamlessly participate in their migration planning, capacity planning, and deployment processes.

SOLUTION

TSG partnered with the client to provide full-service data center migration services, managing and performing the project in a six-month timeframe. During this time, TSG handled Linux and Windows administration, drawing upon a broad knowledge base of network configuration, virtualization, and cloud computing.

Leveraging TSG's proven solutions experience in project management, the client realized cost savings from the consolidation while offloading all merger-related data center responsibilities to TSG.

TSG's Offering: Elements of Managed Solutions

Solution Development

We work with clients to develop an optimal project plan and execution strategy.

Building & Scaling Teams

We build a team with highly sought-after experience, scaling the team as the project scales.

Service Delivery

We own engagement oversight and ensure you meet your deliverables.

Technology

Software Development

VMWare, Linux, CentOS & Windows
